

# Care & Maintenance

For your Billiard Table

Numerous natural products (wood, natural rubber, cotton, slate, etc.) are installed in every professional billiard table, and for their optimal material properties it must be ensured that they are always used and maintained properly. To ensure the long-term enjoyment and optimal functionality of your table, please note the following:

## Directions for use:

Do not expose your pool table to extreme temperature influences. We recommend a constant room temperature of 18–22 degrees Celsius in combination with an air humidity between 45–60%. Avoid direct contact with liquids or heat. Failure to observe these recommended values can result in

- warp or tear of the installed wooden elements
- the rubber cushions harden or become porous
- the slate plates settle
- the billiard cloth wears out faster

and there for the playability and ball-roll properties of your table can significantly change.

## Maintenance instructions:

In order to extend the lifespan of your billiard table - especially the cloth - we recommend brushing it regularly and vacuuming the composite particles with a vacuum cleaner with reduced suction power. Natural wear and tear cannot be avoided due to various factors such as temperature, humidity, abrasive movements, chalk dust and contact with sharp edges.

For that reason, we recommend a professional table inspection by a specialist every 650 - 700 hours of playing time (at least once a year), who can analyse all material properties and carry out corresponding maintenance work directly.

Please note that we cannot give a guarantee if the above-mentioned instructions for use have been violated or repair work has been carried out by unauthorized persons.
